

# Summary

---

- Good PM is not enough to warranty that a project succeeds
- But bad PM is enough to warranty that a project is late, over budget and does not deliver the needed functionality
- Key activities in PM are project planning, cost and effort estimation, project tracking, project organization, risk management
- Key tools are Work breakdown structure, product breakdown structure (VPM in software projects), Gantt and Pert charts, process and product measures.

# Outline

# Concepts and techniques

## Concepts and Techniques

---

- Concepts
  - ◆ Resource
  - ◆ Phase, Activity
  - ◆ Milestone
  - ◆ Deliverable
- Techniques
  - ◆ Pert, Gantt, WBS, PBS

# Resource

---

- Person
- Tool

# Activity, phase

---

- Activity
  - ◆ Time passed by resource to perform defined, coherent task
- Phase
  - ◆ Set of activities

# Milestone

---

- Key event/condition in the project
- with effects on subsequent activities
- ex. requirement document accepted by the customer
  - ◆ if yes then ..
  - ◆ if no then ..

# Deliverable

---

- Product (final or intermediate) in the process
  - ◆ Cfr requirements document, prototype
- internal (for producer) or external (for customer)
- contractual value or not

# WBS

- Work Breakdown Structure
- Hierarchical decomposition of activities in subactivities
- no temporal relationships

Table 3.1. Phases, steps and activities of building a house.

| Phase 1: Landscaping the lot                           |  | Phase 2: Building the house                      |  |
|--|--|--|--|
| <i>Step 1.1: Clearing and grubbing</i>                 |  | <i>Step 2.1: Prepare the site</i>                |  |
| Activity 1.1.1: Remove trees                           |  | Activity 2.1.1: Survey the land                  |  |
| Activity 1.1.2: Remove stumps                          |  | Activity 2.1.2: Request permits                  |  |
| <i>Step 1.2: Seeding the turf</i>                      |  | Activity 2.1.3: Excavate for the foundation      |  |
| Activity 1.2.1: Aerate the soil                        |  | Activity 2.1.4: Buy materials                    |  |
| Activity 1.2.2: Disperse the seeds                     |  | <i>Step 2.2: Building the exterior</i>           |  |
| Activity 1.2.3: Water and weed                         |  | Activity 2.2.1: Lay the foundation               |  |
| <i>Step 1.3: Planting shrubs and trees</i>             |  | Activity 2.2.2: Build the outside walls          |  |
| Activity 1.3.1: Obtain shrubs and trees                |  | Activity 2.2.3: Install exterior plumbing        |  |
| Activity 1.3.2: Dig holes                              |  | Activity 2.2.4: Exterior electrical work         |  |
| Activity 1.3.3: Plant shrubs and trees                 |  | Activity 2.2.5: Exterior siding                  |  |
| Activity 1.3.4: Anchor the trees and mulch around them |  | Activity 2.2.6: Paint the exterior               |  |
|  |  | Activity 2.2.7: Install doors and fixtures       |  |
|  |  | Activity 2.2.8: Install roof                     |  |
|  |  | <i>Step 2.3: Finishing the interior</i>          |  |
|  |  | Activity 2.3.1: Install the interior plumbing    |  |
|  |  | Activity 2.3.2: Install interior electrical work |  |
|  |  | Activity 2.3.3: Install wallboard                |  |
|  |  | Activity 2.3.4: Paint the interior               |  |
|  |  | Activity 2.3.5: Install floor covering           |  |
|  |  | Activity 2.3.6: Install doors and fixtures       |  |

# WBS

---

- Requirements planning
  - ◆ Review existing systems
  - ◆ Perform work analysis
  - ◆ Model process

**Table 3.2. Milestones in building a house.**

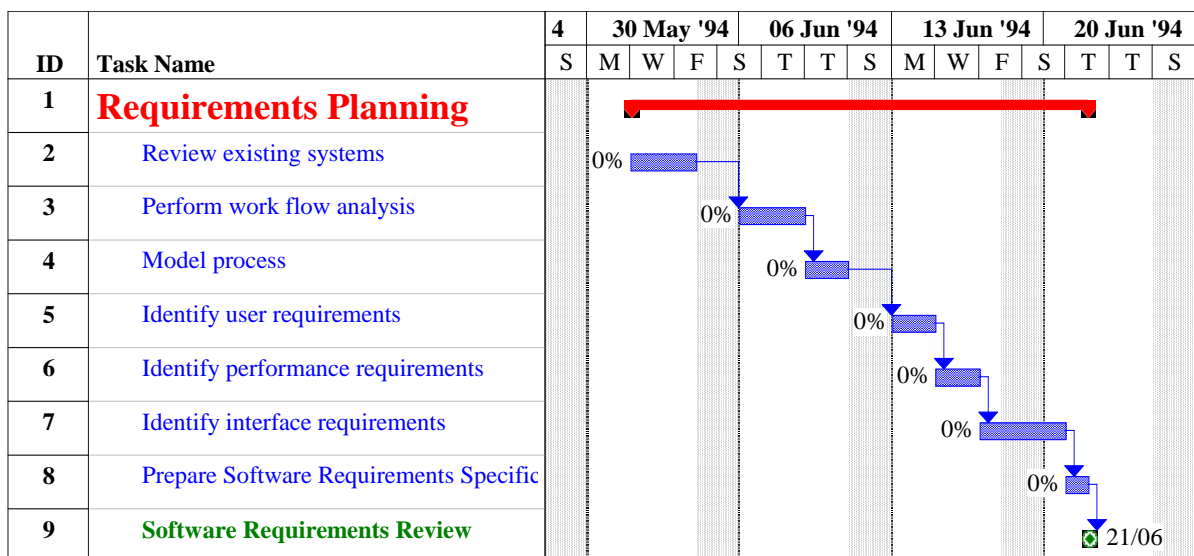

|  |
|--|
| 1.1. Survey complete                   |
| 1.2. Permits issued                    |
| 1.3. Excavation complete               |
| 1.4. Materials on hand                 |
| 2.1. Foundation laid                   |
| 2.2. Outside walls complete            |
| 2.3. Exterior plumbing complete        |
| 2.4. Exterior electrical work complete |
| 2.5. Exterior siding complete          |
| 2.6. Exterior painting complete        |
| 2.7. Doors and fixtures mounted        |
| 2.8. Roof complete                     |
| 3.1. Interior plumbing complete        |
| 3.2. Interior electrical work complete |
| 3.3. Wallboard in place                |
| 3.4. Interior painting complete        |
| 3.5. Floor covering laid               |
| 3.6. Doors and fixtures mounted        |

# PERT

# PERT

directed acyclic graph:

node = activity, arrow = precedence relationship

# Critical path analysis

---

- What is shortest time to complete the project?
- What are the critical activities to complete the project in shortest time?
- Critical activities are the ones on the critical path(s)

## Critical path

---

Path with longest duration

(1) START label with (0,0)

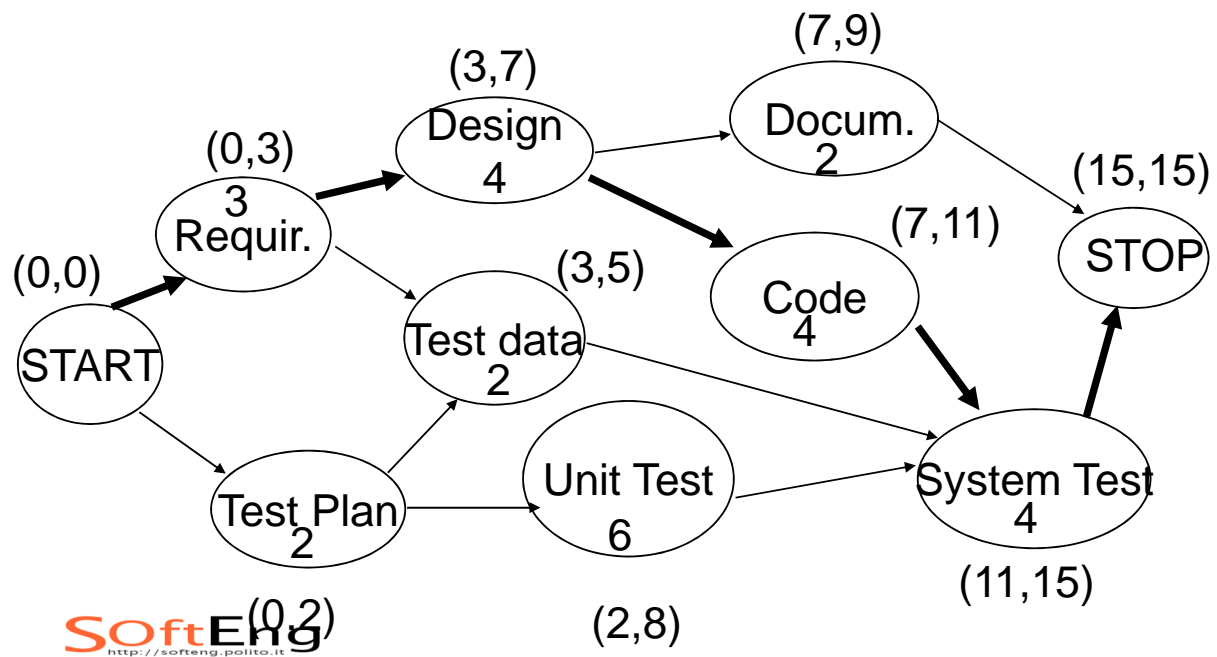

(2) For each node N whose predecessors are labeled:  
SN = max {Si} Si: end time for i-th predecessor

label N with (SN, SN+duration)

(3) Repeat (2) until all nodes labeled

# Example

---

## Analysis

---

Late start

latest time an activity can be started without changing end time of project

Slack time

Admissible delay to complete an activity

# To Compute “Slack Time”

---

*Start from graph (S,F) from critical path analysis, for each node compute new labels (S',F'), max start and end times*

1. For STOP (S', F')=(S,F).
2. For each node whose successors are labeled (S', F') compute min S', that becomes F' for the node

$$S' = F' - \text{duration}$$

$$\text{Slack Time} = S' - S \text{ (or also } F' - F)$$

3. Repeat

## Managerial Implications

---

1. Use slack time to delay start time, or lengthen, an activity
2. If duration of activity on critical path lengthens by X, the whole project is delayed by X
3. If only one critical path exists, reducing duration of any activity on critical path shortens duration of project.

---

# Measures

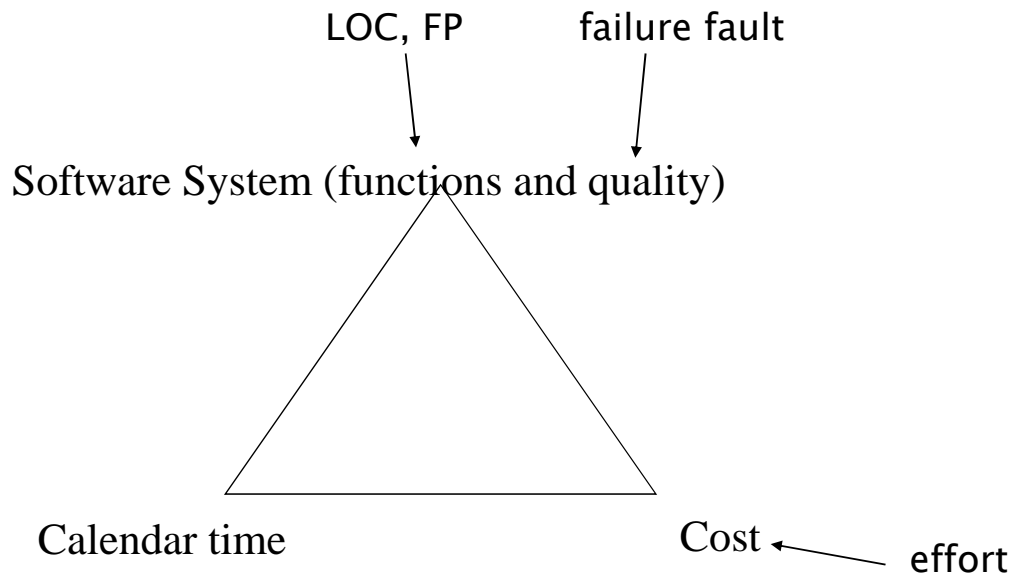

## Relevant software measures

---

- Process measures
  - ◆ time, effort, cost
  - ◆ productivity
  - ◆ earned value
  - ◆ fault, failure, change
- Product measures
  - ◆ Functionality (FP)
  - ◆ Size
  - ◆ Price
  - ◆ Modularity
  - ◆ Other .. ilities

# Measures

---

No notion of unpredictable events here

## Calendar time, or duration

---

- Days, weeks, months, on calendar
- Relative, from project start
  - ◆ Month1, month2, etc
  - ◆ Typically used in planning
- Absolute
  - ◆ September 12
  - ◆ Typically used in controlling
  - ◆ Remark, transition relative → actual is not 1 to 1 (vacations, etc)

# Effort

---

- time taken by staff to complete a task
- Depends on calendar time and on people employed
- Measured in person hours (IEEE 1045)
  - ◆ person day, person month, person year depend on national and corporation parameters
  - ◆ Converts in cost
  - ◆ Staff cost = person hours \* cost per hour

# Effort

---

- ◆ 1 person works 6 hours → 6 ph
- ◆ 2 persons work 3 hour → 6 ph
- ◆ 6 persons work 1 hour → 6ph

# Calendar time vs. effort

---

- Always linked
- Mathematical link. 6 ph can last
  - ♦ 6 calendar hours if 1 person works
  - ♦ 3 calendar hours if 2 persons work in parallel
  - ♦ 1 calendar hour if 6 persons work in parallel
- Practical constraint
  - ♦ Is it feasible?
    - One woman makes a baby in 9 months
    - 9 women make a baby in one month?

# Costs – roles

---

# Cost – vendor

---

- Personnel
  - ◆ Staff
    - Person hours, salary
    - Overhead costs (office space, heating/cooling, telephone, electricity, cleaning, ..)
  - ◆ Hardware
    - Development platform, (target platform)
  - ◆ Software
    - Licenses (OS, DB, tools ..)

# Cost – user

---

- Total Cost of Ownership (TCO)
  - ◆ Considers the complete time window involving the product
  - ◆ At least three phases
    - Before acquisition
    - Usage
    - Dismissal

## Cost – user (2)

---

- Before acquisition
  - ◆ Costs to define requirements and select the product
    - Market analysis, feasibility studies, requirement definition, vendor / product evaluation, contract negotiation
- Acquisition
  - ◆ Acquisition cost
    - one time fee, yearly fee, usage fee
  - ◆ Acquisition cost (= price)  $\Leftrightarrow$  vendor cost + profit

## Cost – user (3)

---

- After acquisition
  - ◆ Deployment costs
    - Install in all users machines
    - Training for users
    - Learning curve
  - ◆ Operation costs
    - Servers, network
  - ◆ Maintenance costs
    - Collection of anomalies, effect of anomalies
    - Corrective, evolutive, enhancement

# Cost – user (4)

---

- Dismissal
  - ◆ Uninstall product
  - ◆ Back up data, data conversion ..

# TCO

---

- The longer the time frame, the less important the acquisition cost
  - ◆ Ex, commercial airplane
  - ◆ Time frame: 20 years (50.000 hours)
  - ◆ Cost of airplane = 1/6 of TCO
    - Key cost factors are fuel, crew, maintenance

# Costing and pricing

---

- Estimates are made to discover the cost, to the developer, of producing a software system
- There is not a simple relationship between the development cost and the price charged to the customer
- Broader organisational, economic, political and business considerations influence the price charged

## Software pricing factors

---

| Factor                    | Description  |
|---------------------------|--|
| Market opportunity        | A development organisation may quote a low price because it wishes to move into a new segment of the software market. Accepting a low profit on one project may give the opportunity of more profit later. The experience gained may allow new products to be developed. |
| Cost estimate uncertainty | If an organisation is unsure of its cost estimate, it may increase its price by some contingency over and above its normal profit.   |
| Contractual terms         | A customer may be willing to allow the developer to retain ownership of the source code and reuse it in other projects. The price charged may then be less than if the software source code is handed over to the customer.  |
| Requirements volatility   | If the requirements are likely to change, an organisation may lower its price to win a contract. After the contract is awarded, high prices may be charged for changes to the requirements.  |
| Financial health          | Developers in financial difficulty may lower their price to gain a contract. It is better to make a small profit or break even than to go out of business.   |

# Size

---

- Of source code
  - ◆ LOC (Lines of Code)
- Of documents
  - ◆ Number of pages
  - ◆ Number of words, characters, figures, tables

# Size

---

- Of entire project
  - ◆ Function points (see later)
  - ◆ LOC
    - In this case LOCs virtually include all documents (non code) produced in the application
    - Ex. project produces 10 documents (1000 pages) and 1000 LOCs. By convention project size is 1000 LOCs

# LOC

---

- What to count
  - w/wout comments
  - w/wout declarations
  - w/wout blank lines
- What to include or exclude
  - ♦ Libraries, calls to services etc
  - ♦ Reused components
- Comparison for different languages not meaningful
  - ♦ C vs Java? Java vs C++? C vs ASM?

# Productivity

---

- Output/effort
- What is output in software?
  - ♦  $\text{Size/effort} = \text{LOC} / \text{effort}$ 
    - Inherits problems of LOC
  - ♦  $\text{Functionality/effort} = \text{FP/effort}$
  - ♦  $\text{Object Points} / \text{effort}$

# LOC/effort

---

- The lower level the language, the more productive the programmer
  - ♦ The same functionality takes more code to implement in a lower-level language than in a high-level language
- The more verbose the programmer, the higher the productivity
  - ♦ Measures of productivity based on lines of code suggest that programmers who write verbose code are more productive than programmers who write compact code

## High and low level languages

---

Low-level language

High-level language

# Productivity paradox

---

|            | analysis            | design               | coding             | testing | doc |
|------------|---------------------|----------------------|--------------------|---------|-----|
| Low level  | 3<br>[person weeks] | 5                    | 8                  | 10      | 2   |
| High level | 3                   | 5                    | 4                  | 6       | 2   |
|            | size                | effort               | productivity       |         |     |
| Low level  | 5000<br>[Loc]       | 28<br>[person weeks] | 714<br>[Loc/month] |         |     |
| High level | 1500                | 20                   | 300                |         |     |

---

## Productivity figures

---

- Real-time embedded systems, 40–160 LOC/P-month
- Systems programs , 150–400 LOC/P-month
- Commercial applications, 200–800 LOC/P-month
  
- Source: Sommerville

# Productivity figures

---

- Manufacturing                      ▪ 0.34 FP/person hour
- Retail                                    ▪ 0.25
- Public administration            ▪ 0.23
- Banking                                ▪ 0.12
- Insurance                              ▪ 0.12

Source: Maxwell, 1999

# Factors affecting productivity

---

| <b>Factor</b>                 | <b>Description</b>   |
|-------------------------------|--|
| Application domain experience | Knowledge of the application domain is essential for effective software development. Engineers who already understand a domain are likely to be the most productive. |
| Process quality               | The development process used can have a significant effect on productivity. This is covered in Chapter 31.   |
| Project size                  | The larger a project, the more time required for team communications. Less time is available for development so individual productivity is reduced.                  |
| Technology support            | Good support technology such as CASE tools, supportive configuration management systems, etc. can improve productivity.  |
| Working environment           | As discussed in Chapter 28, a quiet working environment with private work areas contributes to improved productivity.  |

# Quality and productivity

---

- ◆ All metrics based on size/effort are flawed because they do not take quality into account
- ◆ Productivity may generally be increased at the cost of quality
- ◆ It is not clear how productivity/quality metrics are related
- ◆ If change is constant then an approach based on counting lines of code is not meaningful

## Failure vs. Fault

---

- Failure
  - ◆ malfunction perceived by the user
- Fault
  - ◆ defect in the system, may cause failure or not

# Failure

---

- data to collect
  - calendar time, project time, execution time
  - effect (bad data, loss of data, ...)
  - location (product type, id)
  - gravity (human injury, economic loss, ..)
  - user profile
  - related fault(s)
- measures
  - classification, count per class
  - average time intervals

# Fault

---

- data to collect
  - ◆ effect (related failure, if any)
  - ◆ location (product type, id)
  - ◆ type (e.g. missing req, uninitialized var, logic error, .. )
  - ◆ cause (communication, misunderstanding, clerical, .. )
  - ◆ detecting method (test, inspection, ..)
  - ◆ effort (finding and report handling)

# Change

---

- data to collect
  - ◆ location
  - ◆ cause (related fault if corrective, adaptive, perfective)
  - ◆ effort
- measures
  - ◆ cost of failure

# Fault, Failure, Change

---

- measures
  - ◆ n open failures
  - ◆ duration/effort to close a failure
  - ◆ n failures discovered per v&v activity
  - ◆ fault/failure density
    - faults/failures per module
    - faults/failures per fp
    - faults/failures per loc
  - ◆ changes per document

# Quality – Fault densities – benchmark

---

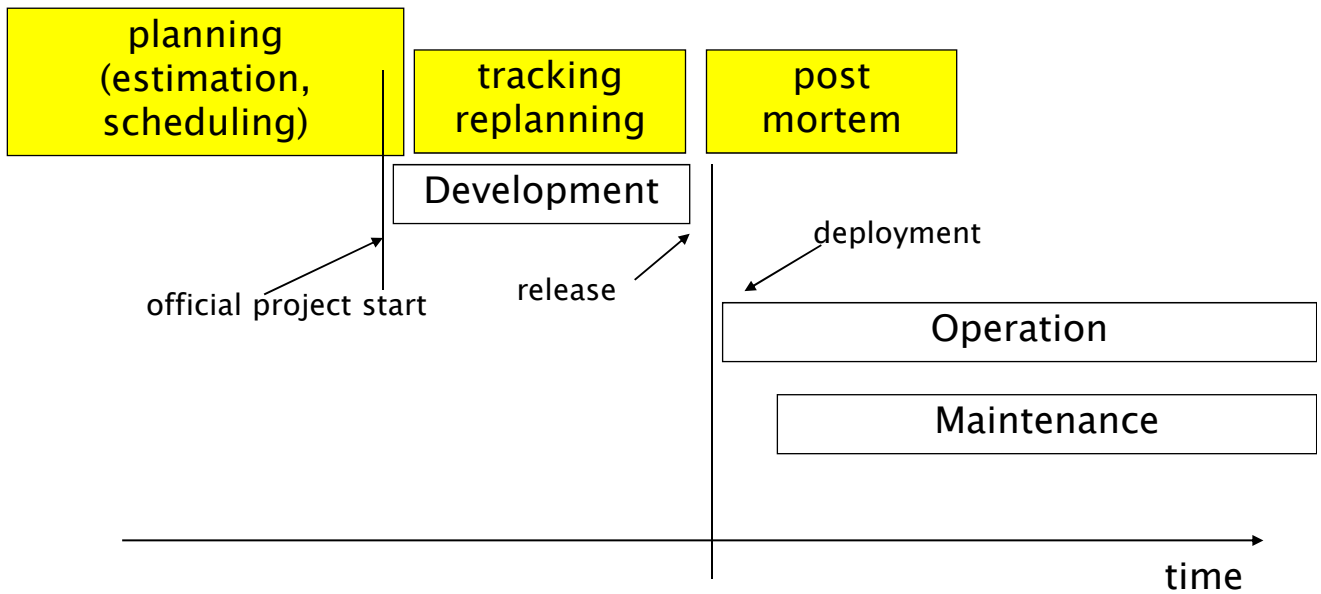

- ◆ Good:  $< 1$  fault/1KLOC
- ◆ Bad:  $> 10$  fault/1KLOC
  - Faults found in operation, 12 months after release
- ◆ Prerelease:
  - 10–30 fault/1KLOC
- ◆ Factor 10 between pre and post release

---

## The PM process

# The PM process

---

---

## Planning

# Planning Process

---

- Identify activities and/or deliverables
  - ◆ PBS, WBS
  - ◆ reference models (CMM, ISO12207)
- estimate effort and cost
- define schedule (Gantt)
- analyze schedule (Pert)

# Project plan

---

- living document
  - ◆ will be updated during tracking
- outline
  - ◆ list of deliverables, activities
  - ◆ milestones
  - ◆ Gantt
  - ◆ Pert
  - ◆ personnel organization
  - ◆ roles and responsibilities

---

# Estimation

## Estimation of cost and effort

---

- Based on analogy
  - ◆ requires experience from the past to ‘foresee’ the future
    - Experience can be qualitative (in mind of people) or quantitative (data collected from past projects)
  - ◆ the closer a project to past projects, the better the estimation

# Estimation accuracy

---

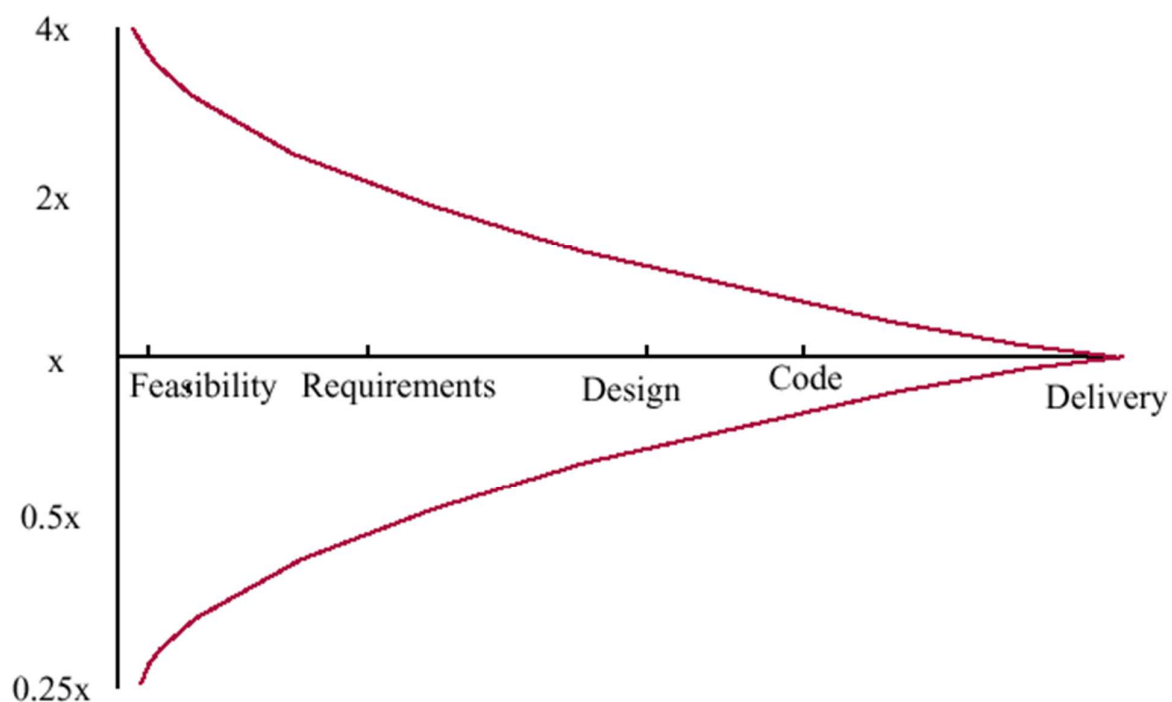

- ◆ The cost/effort/size of a software system can only be known accurately when it is finished
- ◆ Several factors influence the final size
  - Use of COTS and components
  - Programming language
  - Distribution of system
- ◆ As the development process progresses then the estimate becomes more accurate

**SoftEng**  
<http://softeng.polito.it>

---

# Estimate uncertainty

---

# Estimation techniques

---

- Not suggested, but used ..
  - ♦ Parkinson's law
  - ♦ Pricing to win

## Techniques – suggested

---

- Based on judgment
  - ♦ Decomposition
    - By activity (WBS)
    - By products (PBS)
  - ♦ Expert judgment
  - ♦ Delphi
- Based on data from the company
  - ♦ Analogy, case based
  - ♦ Regression models
- Based on data, from outside the company
  - ♦ Cocomo, Cocomo2
  - ♦ Function points
  - ♦ Object points

# Parkinson's Law

---

- The project costs whatever resources are available
- Advantages: No overspend
- Disadvantages: System is usually unfinished

# Pricing to win

---

- The project costs whatever the customer has to spend on it
- Advantages: You get the contract
- Disadvantages: The probability that the customer gets the system he or she wants is small. Costs do not accurately reflect the work required

# By decomposition

---

- By activity
  - ◆ Identify activities (WBS)
  - ◆ Estimate effort per activity
  - ◆ Aggregate (linear)
  
- By product
  - ◆ Identify products (PBS)
  - ◆ Estimate effort per product
  - ◆ Aggregate (linear)
  
- Rationale: easier to estimate smaller parts

**Table 3.3. Activities and time estimates.**

| Activity                                       | Time estimate (in days) |
|--|-------------------------|
| <i>Step 1: Prepare the site</i>                |                         |
| Activity 1.1: Survey the land                  | 3                       |
| Activity 1.2: Request permits                  | 15                      |
| Activity 1.3: Excavate for the foundation      | 10                      |
| Activity 1.4: Buy materials                    | 10                      |
| <i>Step 2: Building the exterior</i>           |                         |
| Activity 2.1: Lay the foundation               | 15                      |
| Activity 2.2: Build the outside walls          | 20                      |
| Activity 2.3: Install exterior plumbing        | 10                      |
| Activity 2.4: Exterior electrical work         | 10                      |
| Activity 2.5: Exterior siding                  | 8                       |
| Activity 2.6: Paint the exterior               | 5                       |
| Activity 2.7: Install doors and fixtures       | 6                       |
| Activity 2.8: Install roof                     | 9                       |
| <i>Step 3: Finishing the interior</i>          |                         |
| Activity 3.1: Install the interior plumbing    | 12                      |
| Activity 3.2: Install interior electrical work | 15                      |
| Activity 3.3: Install wallboard                | 9                       |
| Activity 3.4: Paint the interior               | 18                      |
| Activity 3.5: Install floor covering           | 11                      |
| Activity 3.6: Install doors and fixtures       | 7                       |

# Expert judgement

---

- one or more experts (chosen in function of experience) propose an estimate

# Delphi

---

- evolution of expert judgement
- structured meetings to achieve consensus in estimate
  - ◆ each participant proposes estimate (anonymous)
  - ◆ team leader publishes synthesis
    - $(a + 4m + b)/6$  (beta distribution)
    - a best - b worst - m mean
  - ◆ iterate

# By analogy, case based

---

- A set of projects
- Each project has a number of attributes (with respective values)
  - ♦ Ex size, technology, staff experience, effort, duration, etc
- Define attributes for new project
- Find 'near' project(s)
  - ♦ Distance function
- Use (adapted) effort of near project

## Ex.

---

- ♦ See file MaxwellDataSetChap1.xls
- New project
  - ♦ We estimate
    - size = 200fp, application type = transpro, telonuse = no
  - ♦ Near projects (yellow rows) have effort
    - 7320, 1520, 963, 5578
  - ♦ We estimate effort at
    - Average of effort of yellow projects = 3845

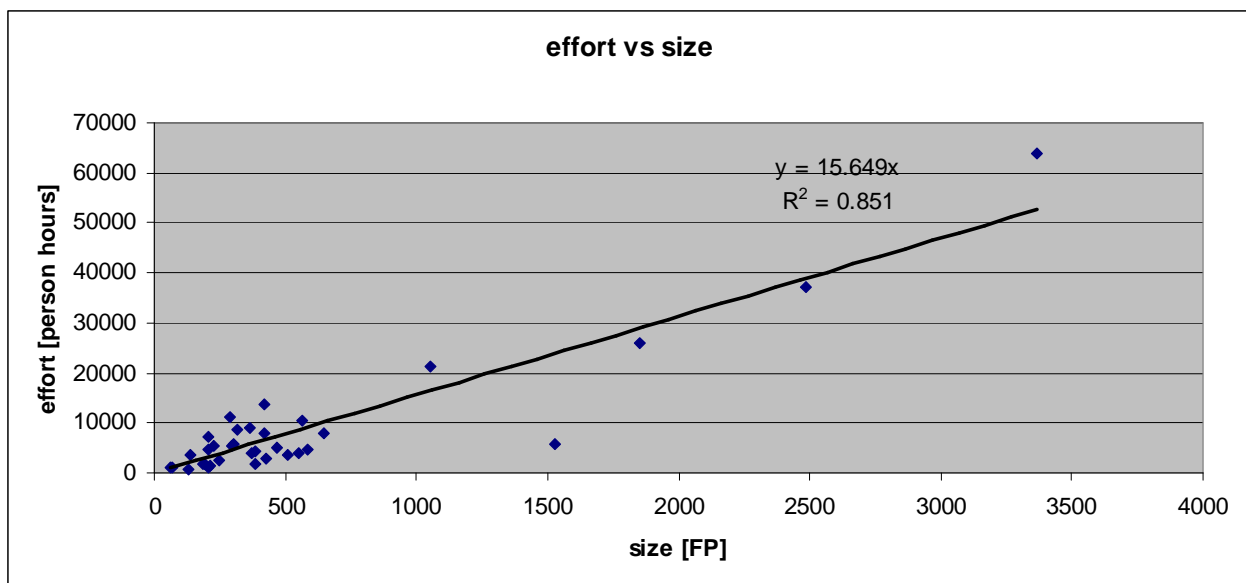

# Regression models

---

- If the company has a data base of past projects
  - ♦ min info required: size, effort
  - ♦ See file MaxwellDataSetChap1.xls
- apply regression (linear, or else)
- Estimate productivity
- Estimate size, compute effort

## Linear regression

---

# Ex.

---

- Using Maxwell data set, linear regression effort vs. size on all projects gives
  - ♦ Productivity =  $1/15.649$  fp/person hour  
0.063 fp per person hour
  - ♦  $R^2 = 0.85$  (good model)
- Given new project
  - ♦ We estimate size = 200fp
  - ♦ Estimated effort =  $200 * 15.649 = 3773$  ph

# Function Points

---

- $fp = A * EI + B * EO + C * EQ + D * EIF + E * ILF$ 
  - ♦ EI = number of Input Item
  - ♦ EO = output item
  - ♦ EQ = Inquiry
  - ♦ EIF = External Interface File
  - ♦ ILF = Internal Logical File

- 
- Coefficients A,B,C,D,E

| Component   | Level of Complexity |         |         |
|-------------|---------------------|---------|---------|
|             | Simple              | Average | Complex |
| Input item  | 3                   | 4       | 6       |
| Output item | 4                   | 5       | 7       |
| Inquiry     | 3                   | 4       | 6       |
| Master file | 7                   | 10      | 15      |
| Interface   | 5                   | 7       | 10      |

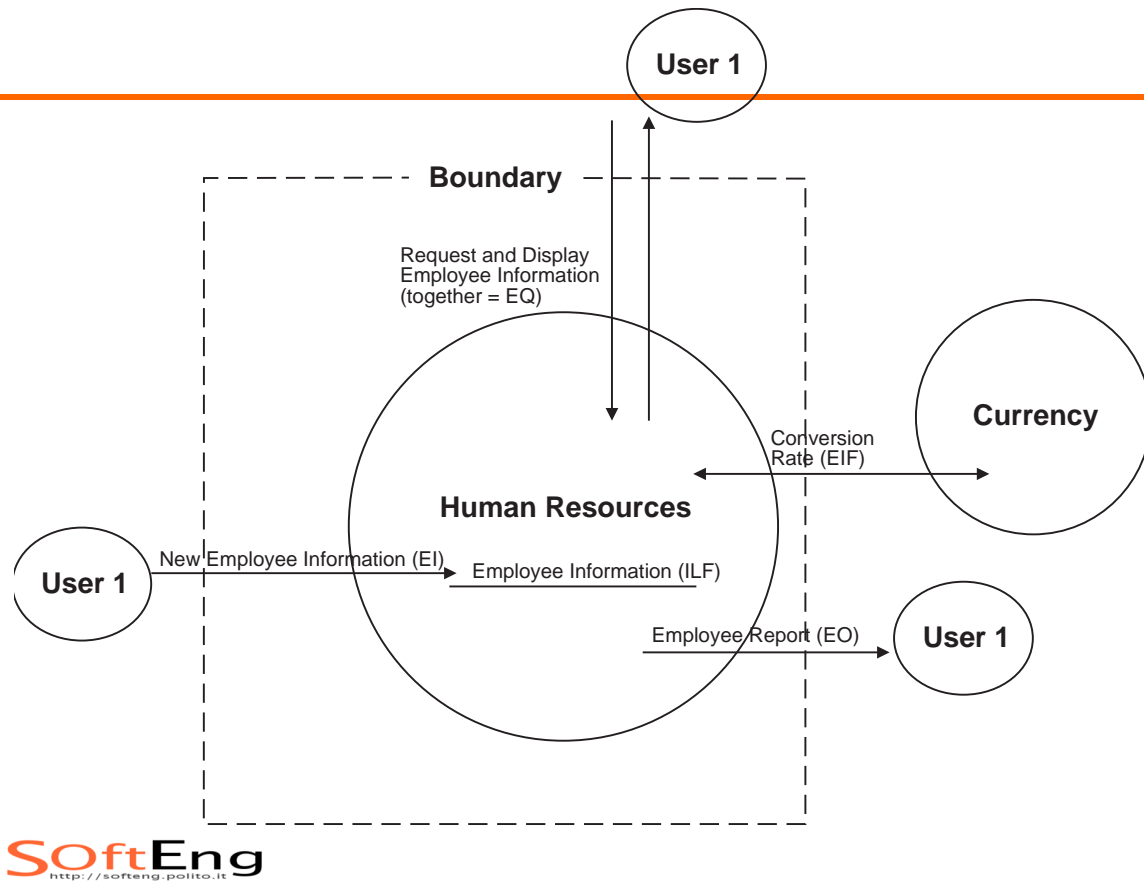

## Function Points

---

- For any product, size in “function points” is given by

$$FP = 4 \times EI + 5 \times EO + 4 \times EQ + 10 \times ILF + 7 \times EIF$$

- A 3-step process.

## Function Points (2)

- 1. Classify each component of product (EI, EO, EQ, ILF, EIF) as simple, average, or complex.
  - ◆ Assign appropriate number of function points
  - ◆ Sum gives UFP (unadjusted function points)

# Function Points (3)

---

- 2. Compute technical complexity factor (TCF)
  - ♦ Assign value from 0 (“not present”) to 5 (“strong influence throughout”) to each of 14 factors such as transaction rates, portability
  - ♦ Add 14 numbers  $\Rightarrow$  total degree of influence (DI)  
$$\text{TCF} = 0.65 + 0.01 \times \text{DI}$$
  - ♦ Technical complexity factor (TCF) lies between 0.65 and 1.35

**SoftEng**  
<http://softeng.polito.it>

---

1. Data communication
2. Distributed data processing
3. Performance criteria
4. Heavily utilized hardware
5. High transaction rates
6. Online data entry
7. End-user efficiency
8. Online updating
9. Complex computations
10. Reusability
11. Ease of installation
12. Ease of operation
13. Portability
14. Maintainability

# Function Points (4)

---

- 3. Number of function points (FP) given by

$$\text{FP} = \text{UFP} \times \text{TCF}$$

**SoftEng**  
<http://softeng.polito.it>

---

# Function Points

---

- suitable for MIS
  - ◆ use of adjustment factors delicate
  - ◆ FP expert should do estimate
    - long, expensive
- conversion tables FP – LOC
  - Cobol 110
  - C 128-162
  - C++ 53-66
  - Java 53-62
- conversion tables FP – effort

 [www.ifpug.org](http://www.ifpug.org)  
http://softeng.polito.it

---

## FP

---

- Advantage
  - ◆ Independent of technology
  - ◆ Independent of programmer
  - ◆ Well established and standardized
- Downside
  - ◆ Counting long and expensive
  - ◆ Transaction system oriented (no real time, no embedded systems)

# FP vs. LOCS

---

|                           | FP                                | LOCs          |
|---------------------------|-----------------------------------|---------------|
| Depend on prog language   | N                                 | Y             |
| Depend on programmer      | N                                 | Y             |
| easy to compute           | N, must be done by trained person | Y, tool based |
| Applicable to all systems | N, transaction oriented           | Y             |

## FP as unit of exchange

---

- Company A bids for FP
  - ◆ Buy 10000 FP, how much? (bid)
  - ◆ providers answer, x Euro per FP
- A selects provider
  - ◆ lowest cost and other factors
- End of year, redo counting
  - ◆ 10123 FP actually delivered
  - ◆ A pays

# Reminder

---

- Measures of size
  - ◆ FP, LOC
- Both can be computed
  - ◆ Before a project start (estimated size)
  - ◆ After a project ends (actual size)
- Both can be used to
  - ◆ Characterize productivity
    - FP/effort, LOC/effort
  - ◆ Characterize application portfolio
    - FP or LOC owned and operated by a company

# Function points

---

- IFPUG
  - ◆ FP Counting Guide
  - ◆ Exams/ certified counters
- GUFPI
- (CNIPA)

# Object points

---

- Object points are an alternative function-related measure to function points when 4GLs or similar languages are used for development
- Object points are NOT the same as object classes

- 
- The number of object points in a program is a weighted estimate of
    - ◆ The number of separate screens that are displayed
    - ◆ The number of reports that are produced by the system
    - ◆ The number of 3GL modules that must be developed to supplement the 4GL code

# Object point estimation

---

- ◆ Object points are easier to estimate from a specification than function points as they are simply concerned with screens, reports and 3GL modules
- ◆ They can therefore be estimated at an early point in the development process. At this stage, it is very difficult to estimate the number of lines of code in a system

## The COCOMO model

---

- ◆ Well-documented, 'independent' model which is not tied to a specific software vendor
- ◆ Long history from initial version published in 1981 (COCOMO-81) through various instantiations to COCOMO 2
- ◆ COCOMO 2 takes into account different approaches to software development, reuse, etc.

# COCOMO 81

---

- Based on 63 project
  - ♦ Various types: scientific, MIS, embedded
  - ♦ Data set then enriched
- Assumes waterfall process
  - ♦ Planning and requirements analysis
  - ♦ Design
  - ♦ Implementation
  - ♦ Integration and test
- Estimate covers 3 latter phases

# COCOMO 81

---

| Project complexity | Formula                           | Description  |
|--------------------|-----------------------------------|--|
| Simple             | $PM = 2.4 (KDSI)^{1.05} \times M$ | Well-understood applications developed by small teams.   |
| Moderate           | $PM = 3.0 (KDSI)^{1.12} \times M$ | More complex projects where team members may have limited experience of related systems.   |
| Embedded           | $PM = 3.6 (KDSI)^{1.20} \times M$ | Complex projects where the software is part of a strongly coupled complex of hardware, software, regulations and operational procedures. |

# Base model

---

- PM = effort in person months
- KDSI = K Delivered Source Instructions
- M = 1

# Intermediate model

---

| Cost Drivers                        | Rating   |      |         |      |           |            |

| Required development schedule       | 1.23     | 1.08 | 1.30    | 1.04 | 1.10      |            |

# M, example

---

| Cost Drivers                        | Situation  | Rating    | Effort Multiplier |
|-------------------------------------|--|-----------|-------------------|
| Required software reliability       | Serious financial consequences of software fault | High      | 1.15              |
| Database size                       | 20,000 bytes                                     | Low       | 0.94              |
| Product complexity                  | Communications processing                        | Very high | 1.30              |
| Execution time constraint           | Will use 70% of available time                   | High      | 1.11              |
| Main storage constraint             | 45K of 64K store (70%)                           | High      | 1.06              |
| Virtual machine volatility          | Based on commercial microprocessor hardware      | Nominal   | 1.00              |
| Computer turnaround time            | Two hour average turnaround time                 | Nominal   | 1.00              |
| Analyst capabilities                | Good senior analysts                             | High      | 0.86              |
| Applications experience             | Three years                                      | Nominal   | 1.00              |
| Programmer capability               | Good senior programmers                          | High      | 0.86              |
| Virtual machine experience          | Six months                                       | Low       | 1.10              |
| Programming language experience     | Twelve months                                    | Nominal   | 1.00              |
| Use of modern programming practices | Most techniques in use over one year             | High      | 0.91              |
| Use of software tools               | At basic minicomputer tool level                 | Low       | 1.10              |
| Required development schedule       | Nine months                                      | Nominal   | 1.00              |

## COCOMO 2 (1997) levels

---

- ◆ a 3 level model that allows increasingly detailed estimates to be prepared as development progresses
- Early prototyping level
  - ◆ Estimates based on object points and a simple formula is used for effort estimation
- Early design level
  - ◆ Estimates based on function points that are then translated to LOC
- Post-architecture level
  - ◆ Estimates based on lines of source code

# Early prototyping level

---

- Supports prototyping projects and projects where there is extensive reuse
- Based on standard estimates of developer productivity in object points/month
- Takes CASE tool use into account

- 
- Formula is
    - ◆  $PM = ( NOP \times (1 - \%reuse/100) ) / PROD$
    - ◆ PM is the effort in person-months, NOP is the number of object points and PROD is the productivity

# Object point productivity

---

|                                       |          |     |         |      |           |
|---------------------------------------|----------|-----|---------|------|-----------|
| Developer's experience and capability | Very low | Low | Nominal | High | Very high |
| ICASE maturity and capability         | Very low | Low | Nominal | High | Very high |
| PROD (NOP/month)                      | 4        | 7   | 13      | 25   | 50        |

## Early design level

---

- Estimates can be made after the requirements have been agreed
- Based on standard formula for algorithmic models
  - ♦  $PM = A \times \text{Size}^B \times M + PM_m$  where
  - ♦  $M = \text{PERS} \times \text{RCPX} \times \text{RUSE} \times \text{PDIF} \times \text{PREX} \times \text{FCIL} \times \text{SCED}$
  - ♦  $PM_m = (\text{ASLOC} \times (\text{AT}/100)) / \text{ATPROD}$

- 
- ◆  $A = 2.5$  in initial calibration, Size in KLOC, B varies from 1.1 to 1.24 depending on novelty of the project, development flexibility, risk management approaches and the process maturity

## Multipliers

---

- ◆ RCPX – product reliability and complexity
- ◆ RUSE – the reuse required
- ◆ PDIF – platform difficulty
- ◆ PREX – personnel experience
- ◆ PERS – personnel capability
- ◆ SCED – required schedule
- ◆ FCIL – the team support facilities
- PM reflects the amount of automatically generated code

# Post-architecture level

---

- Uses same formula as early design estimates
- Estimate of size is adjusted to take into account
  - ♦ Requirements volatility. Rework required to support change
  - ♦ Extent of possible reuse. Reuse is non-linear and has associated costs so this is not a simple reduction in LOC
  - ♦  $ESLOC = ASLOC \times (AA + SU + 0.4DM + 0.3CM + 0.3IM)/100$

- 
- ESLOC is equivalent number of lines of new code. ASLOC is the number of lines of reusable code which must be modified, DM is the percentage of design modified, CM is the percentage of the code that is modified, IM is the percentage of the original integration effort required for integrating the reused software.
  - SU is a factor based on the cost of software understanding, AA is a factor which reflects the initial assessment costs of deciding if software may be reused.

# The exponent term

---

- This depends on 5 scale factors (see next slide). Their sum/100 is added to 1.01
  - Example
    - Precedenteness – new project – 4
    - Development flexibility – no client involvement – Very high – 1
    - Architecture/risk resolution – No risk analysis – V. Low – 5
    - Team cohesion – new team – nominal – 3
    - Process maturity – some control – nominal – 3
- ◆ ~~Scale factor is therefore 1.17~~

SoftEng  
http://www.softeng.com

## Exponent scale factors

---

| Scale factor                 | Explanation  |
|------------------------------|--|
| Precedentedness              | Reflects the previous experience of the organisation with this type of project. Very low means no previous experience, Extra high means that the organisation is completely familiar with this application domain. |
| Development flexibility      | Reflects the degree of flexibility in the development process. Very low means a prescribed process is used; Extra high means that the client only sets general goals.  |
| Architecture/risk resolution | Reflects the extent of risk analysis carried out. Very low means little analysis, Extra high means a complete a thorough risk analysis.  |
| Team cohesion                | Reflects how well the development team know each other and work together. Very low means very difficult interactions, Extra high means an integrated and effective team with no communication problems.            |
| Process maturity             | Reflects the process maturity of the organisation. The computation of this value depends on the CMM Maturity Questionnaire but an estimate can be achieved by subtracting the CMM process maturity level from 5.   |

---

# Multipliers

---

- **Product attributes**
  - concerned with required characteristics of the software product being developed
- **Computer attributes**
  - constraints imposed on the software by the hardware platform
- **Personnel attributes**
  - multipliers that take the experience and capabilities of the people working on the project into account.
- **Project attributes**
  - concerned with the particular characteristics of the software development project

# Project cost drivers

---

| <b>Product attributes</b>   |   |      |   |
|-----------------------------|---|------|---|
| RELY                        | Required system reliability             | DATA | Size of database used   |
| CPLX                        | Complexity of system modules            | RUSE | Required percentage of reusable components                      |
| DOCU                        | Extent of documentation required        |      |   |
| <b>Computer attributes</b>  |   |      |   |
| TIME                        | Execution time constraints              | STOR | Memory constraints  |
| PVOL                        | Volatility of development platform      |      |   |
| <b>Personnel attributes</b> |   |      |   |
| ACAP                        | Capability of project analysts          | PCAP | Programmer capability   |
| PCON                        | Personnel continuity                    | AEXP | Analyst experience in project domain                            |
| PEXP                        | Programmer experience in project domain | LTEX | Language and tool experience                                    |
| <b>Project attributes</b>   |   |      |   |
| TOOL                        | Use of software tools                   | SITE | Extent of multi-site working and quality of site communications |
| SCED                        | Development schedule compression        |      |   |

# Effects of cost drivers

---

## Sw project Data sets

---

- Company specific
  - ◆ When exists
  - ◆ Maxwell, Applied statistics for software managers, Prentice Hall
- Public
  - ◆ Knowledge plan (Caper Jones)
  - ◆ Software productivity research
  - ◆ ISBSG, Int. software benchmarking standards group, [www.isbsg.org](http://www.isbsg.org)

---

# Scheduling

## Project duration

---

- As well as effort estimation, calendar time must be estimated, and staff allocated
- Scheduling can be done on Gantt/Pert
- COCOMO2 gives also an estimate of calendar time
  - ◆ Independent of staffing

- 
- Calendar time can be estimated using a COCOMO 2 formula

- ◆  $TDEV = 3 \times (PM)^{(0.33+0.2*(B-1.01))}$

- ◆ PM is the effort computation and B is the exponent computed as discussed above (B is 1 for the early prototyping model). This computation predicts the nominal schedule for the project

## Staffing requirements

---

- ◆ Staff required can't be computed by dividing the development time by the required schedule
- ◆ The number of people working on a project varies depending on the phase of the project
- ◆ The more people who work on the project, the more total effort is usually required
- ◆ A very rapid build-up of people often correlates with schedule slippage

# Staffing profile

---

- Number of people working on the project vs. time
- Typically has a bell shape
  - ♦ duration of project is constrained by staffing profile + total effort estimated

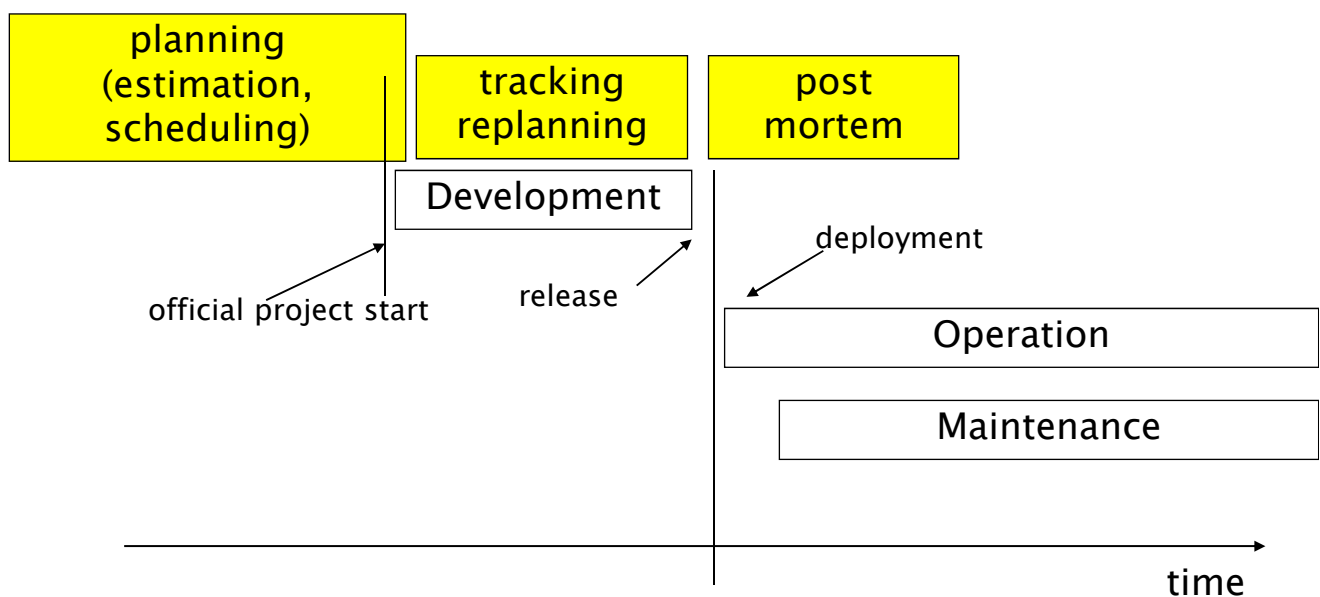

SoftEng  
<http://softeng.polito.it>

---

# The PM process

---

SoftEng  
<http://softeng.polito.it>

---

---

# Tracking

## Tracking process

---

- project has started how to know status of project?
- collect project data, define actual status
- compare estimated – actual
  - ◆ Estimated Gantt is the roadmap for project
- if deviations, do corrective actions
  - ◆ change personnel, change activities, change deliverables, ...
  - ◆ re-plan, update Gantt and PERT

# Project status

---

- Option1
  - Effort spent
- Option2
  - Effort spent + activities closed
- Option3
  - Earned value

# Effort spent

---

- Collect effort spent, compare with estimated
  - ♦ Ex, spent 10, estimated 100, we are done 10%
- Big flaw, confounds input measure (effort spent) with output measure (completion)
  - ♦ Typical result, spent 90, estimated 100, but the remaining 10% takes 100..

# Activities closed

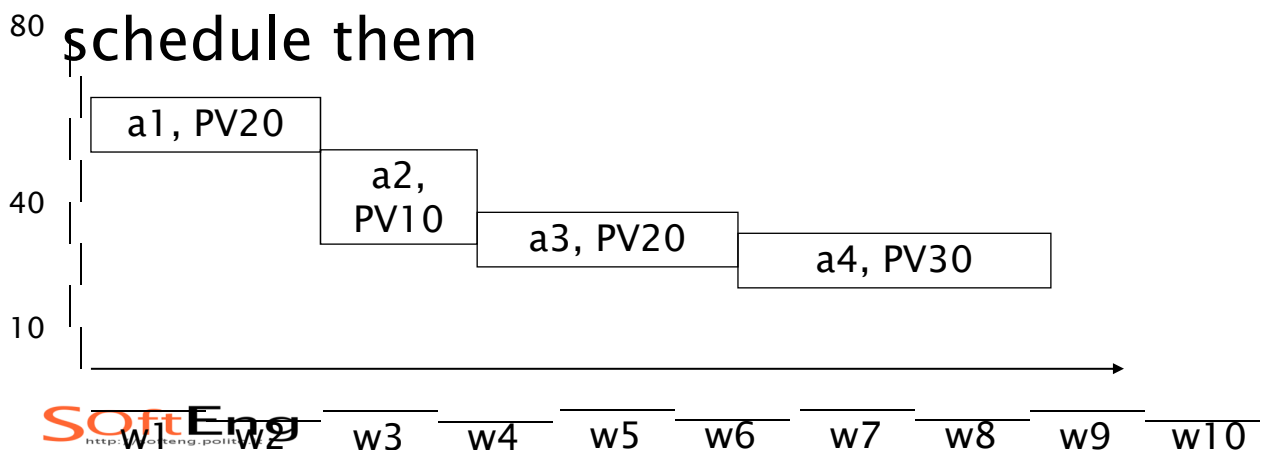

---

- How to define when activity is closed?
  - ♦ All effort planned for activity is spent
    - Same problem, confounds input with output
  - ♦ Define quality gate, level to achieve
    - Ex, requirements: inspection meeting, majority of participants judges document is goodenough
    - Ex, unit testing: coverage 95% of nodes, and all tests pass

# Earned value

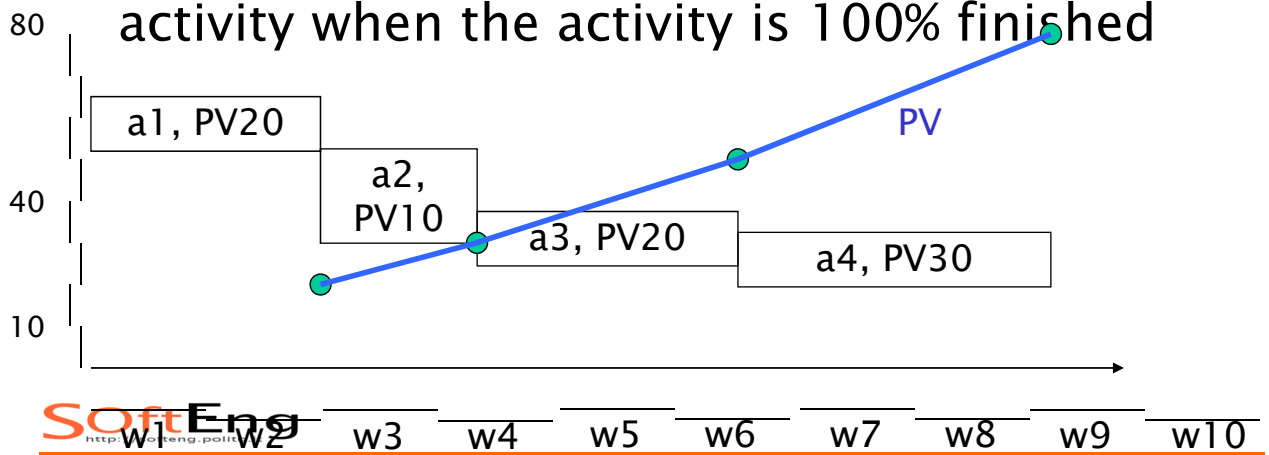

---

- A technique to measure progress of a project
- Step 1: identify activities, assign a value to them (Planned Value, PV), schedule them

# Earned value

- Step 2: define a rule to pass from PV to EV (rule1 0/100 or rule2 0/50/100)
  - ♦ With rule1, the project earns the PV of an activity when the activity is 100% finished

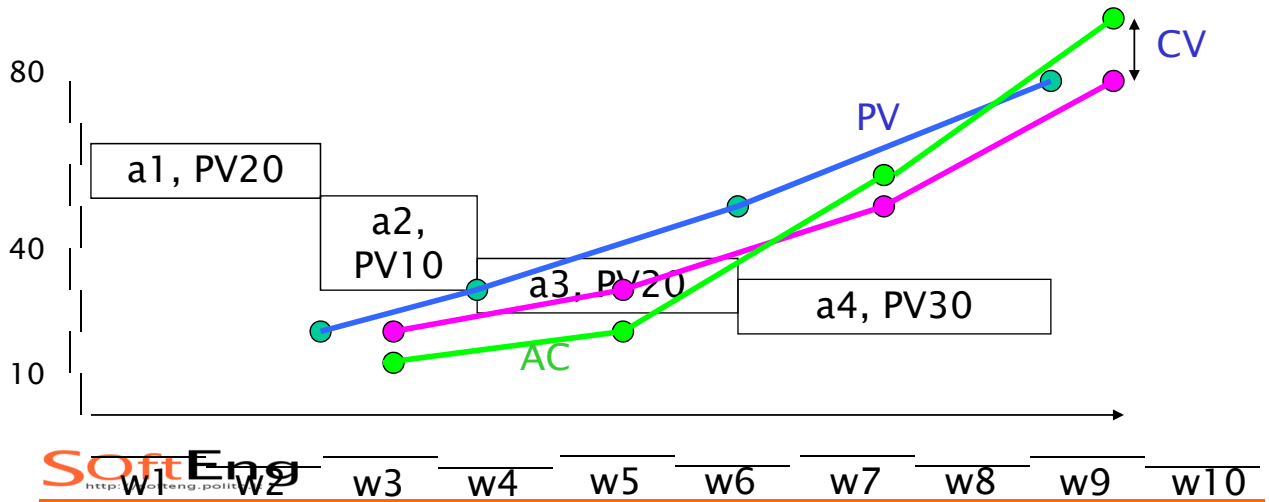

# Earned value

- Step 3: start the project, measure EV and compare with PV

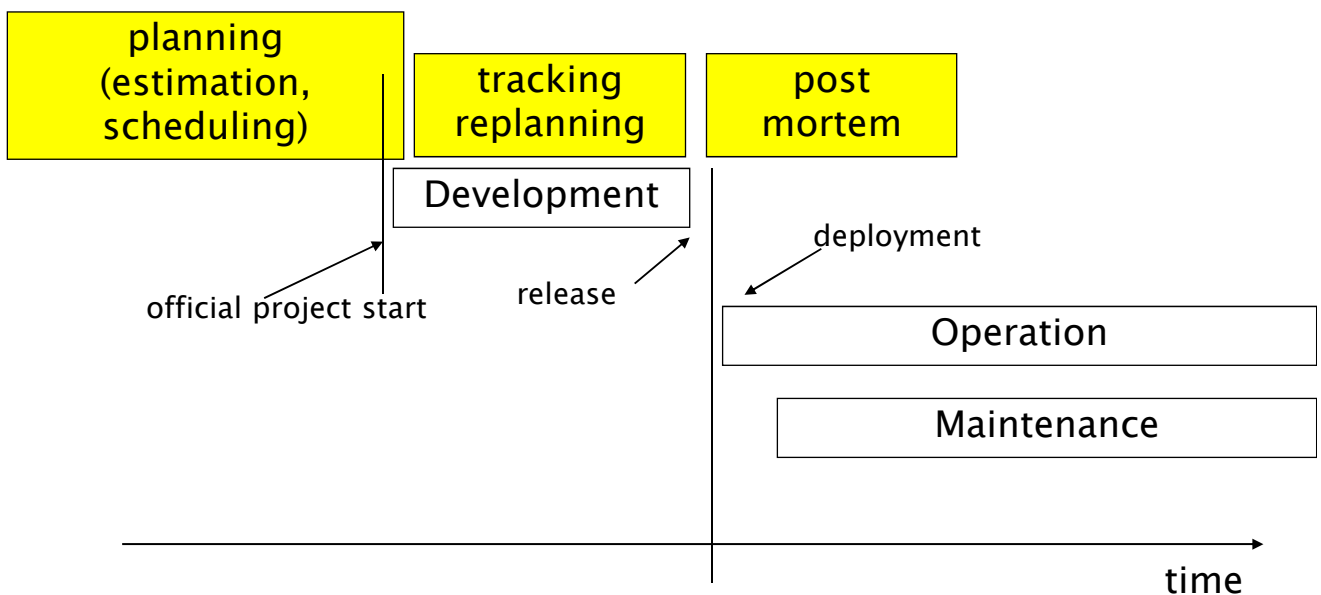

# Earned value

- Step 4: compute also AC, actual cost

# The PM process

---

# Post Mortem

## Post mortem

---

- A form of organizational learning
- Collect key information from the project
  - ◆ Effort, faults – estimated and actual
  - ◆ Achievements
  - ◆ Problems and causes
- To make it available to other projects

# PMA – learn from experience

---

- PMA (when used appropriately) PMA ensures that team members recognise and remember what they learned during a project.
  - PMA identifies improvement opportunities and provides means to initiate sustained change.
  - PMA provides qualitative feedback
  - Two types
    - ♦ General PMA
    - ♦  Focused PMA – understanding and improving a project`s specific activity
- 

## PMA process

---

- Preparation
  - ♦ Study the project history to understand what has happened
  - ♦ Review all available documents
  - ♦ Determine goal for PMA
  - ♦ Example of goal: Identify major project achievements and further improvement opportunities.

# PMA process cont.

---

- Data collection
  - ◆ Gather relevant project experience
  - ◆ Focus on positive and negative aspects
  - ◆ Semistructured interviews – pre-prepared list of questions
  - ◆ Facilitated group discussion
  - ◆ KJ sessions
    - Write down up to four positive and negative project experience on post-it notes.
    - Put the notes on a whiteboard
    - Re-arrange notes into groups and discuss them

# PMA process cont.

---

- Analysis
  - ◆ Feedback session
    - Have we (analyser) understood what you (project member) told us, and do we have all the relevant facts?
  - ◆ Ishikawa diagram in a collaborative process to find the causes for positive and negative experiences
    - Draw an arrow on a whiteboard – which is label with experience
    - Add arrows with causes (the diagram will look like a fishbone)

# PMA – results and experience

---

- Document the PMA results in a project experience report
  - ♦ Project description
  - ♦ Projects main problems, with description and Ishikawa diagrams
  - ♦ Project main success, with descriptions and Ishikawa diagrams
  - ♦ PMA meeting as an appendix (to let the reader see how the team discussed problems and successes)

---

## Collecting and using measures

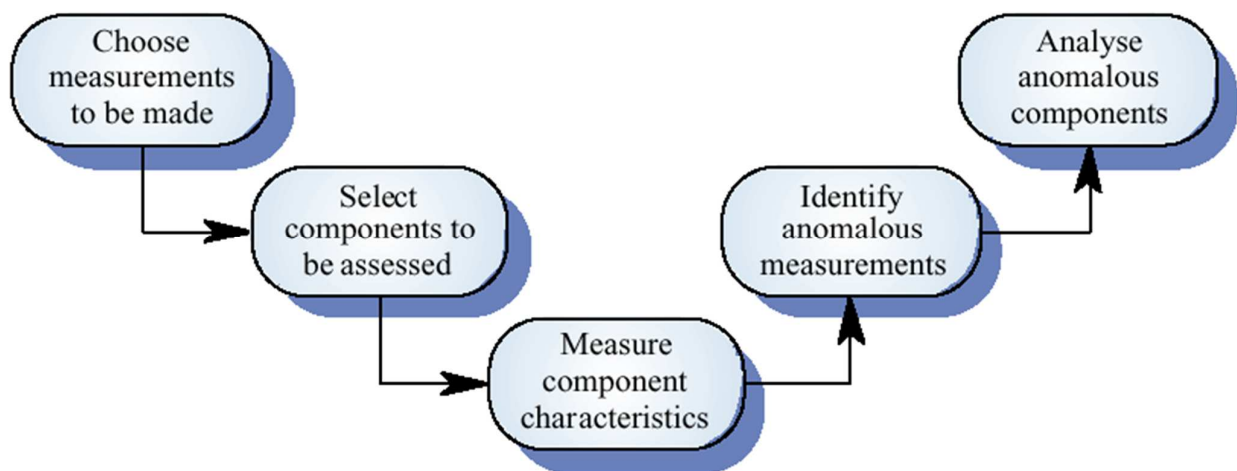

# The measurement process

---

- A process should be defined and implemented to collect data, derive and analyze measures
- Data collected during this process should be maintained as an organisational resource
- Once a measurement database has been established, comparisons across projects become possible

## Product measurement process

---

# GQM

---

- Focus on few, important measures (top down)
- Never “collect everything, analyze later” (bottom up)
  - ◆ Too much data
  - ◆ Not meaningful

## Goal – (similar to KPI)

---

- G1 Satisfying customer
  - ◆ What is satisfaction?
    - Interviews
  - ◆ What is quality of product?
    - Defects after delivery
- G2 produce low cost product
  - ◆ What is cost
    - Cost of development

# Typical indicators

---

- Effort (Cost)
- Size
- Defects after delivery
- Defects during development

# GQM example

---

- Overall research question
  - ◆ Are UML Object diagrams useful?

# Goal

---

- Object of study
  - ♦ UML Static structure diagrams
- Purpose
  - ♦ Evaluate
- Focus
  - ♦ Usefulness
- Point of view
  - ♦ Maintainer comprehending software
- Context
  - ♦ Master degree class

# Data collection

---

- A metrics programme should be based on a set of product and process data
- Data should be collected immediately (not in retrospect) and, if possible, automatically
- Data should be controlled and validated as soon as possible

# Data accuracy

---

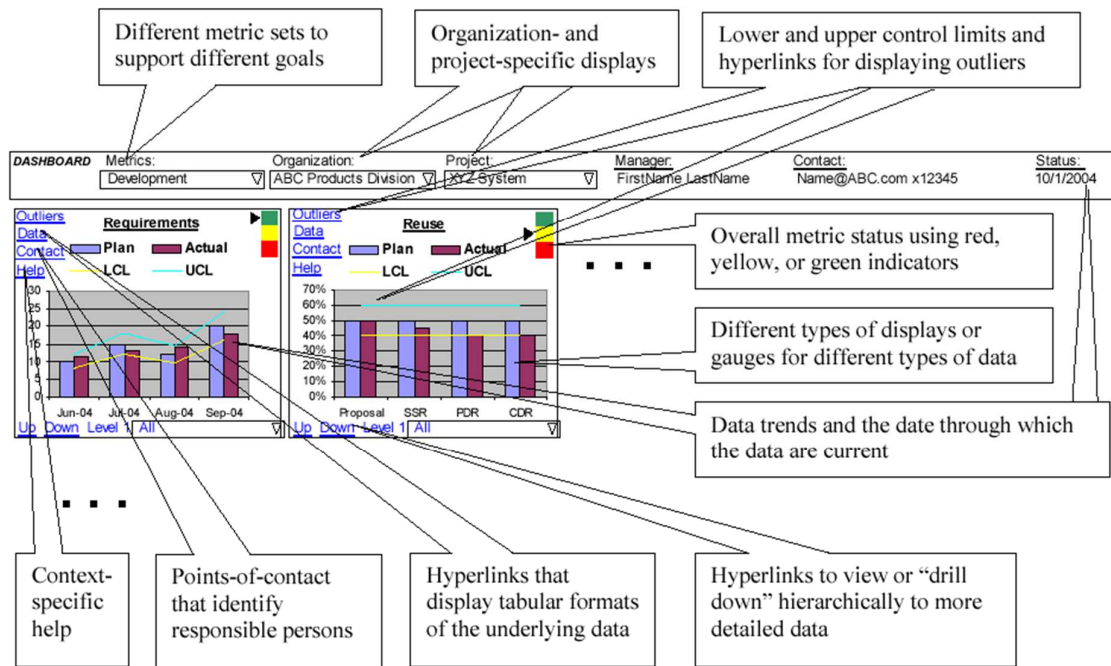

- Don't collect unnecessary data
  - The questions to be answered should be decided in advance and the required data identified
- Tell people why the data is being collected
  - It should not be part of personnel evaluation
- Don't rely on memory
  - Collect data when it is generated not after a project has finished

# Data presentation

---

- Reports
- Web reports
- Dashboard

# Dashboard

# Personnel

# Project personnel

---

- Key activities requiring personnel:
  - ♦ requirements analysis
  - ♦ system design
  - ♦ program design
  - ♦ program implementation
  - ♦ testing
  - ♦ training
  - ♦ maintenance
  - ♦ quality assurance

# Choosing personnel

---

- ability to perform work
- interest in work
- experience with
  - ♦ similar applications
  - ♦ similar tools or languages
  - ♦ similar techniques
  - ♦ similar development environments
- training
- ability to communicate with others
- ability to share responsibility
- management skills

# Work styles

---

- Extroverts: tell their thoughts
- Introverts: ask for suggestions
- Intuitives: base decisions on feelings
- Rationals: base decisions on facts, options

# Organizational structure

---

- Depends on
  - ◆ backgrounds and work styles of team members
  - ◆ number of people on team
    - n people, max interactions =  $n^2/2$
  - ◆ management styles of customers and developers
- Examples:
  - ◆ Chief programmer team
  - ◆ Egoless approach

# Organizational structures

---

## Highly structured

- high certainty
- repetition
- large project

## Loosely structured

- uncertainty
- new technology
- small projects

---

# Risk management

# Risk management

---

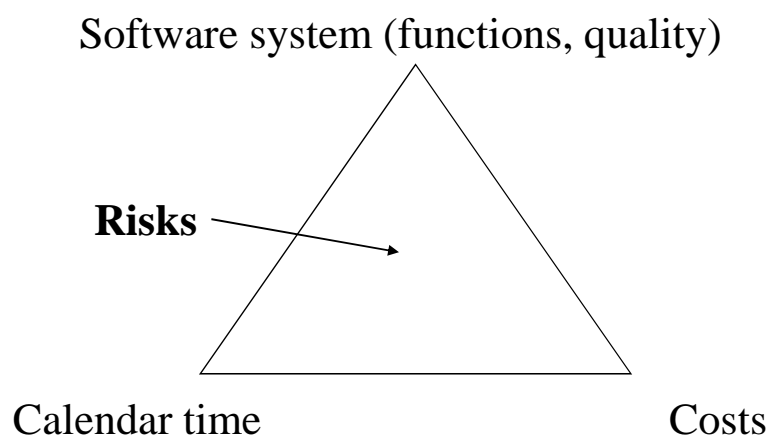

- Project Management for adults

If you don't actively attack the risks,  
they will actively attack you

Tom Gilb

# Risk Management

---

# Strategies

---

- Reactive
  - ♦ “Indiana Jones school of risk management”
  - ♦ Risk management = Crisis management (“fire-fighting mode”)
- Proactive

## Risk management (proactive)

---

- Identify risks
- analyze them
- quantify effects
- define strategies and plans to handle them

# Risk

---

- ◆ Future event that can have (bad) impact on project

## Risk categories

---

- Project
- Technical
- Business
  
- Known
- Predictable
- Unknown

# Project Risks

---

- Regarding (ill defined) project plan
  - ◆ budget, personnel, timings, resources, customers
- Regarding management
  - ◆ No management support
  - ◆ Missing budget or people

# Technical risks

---

- Regard feasibility of product
  - ◆ Design, interfaces, verification, ..

# Business risks

---

- Regarding market or company
  - ◆ No market for the product (*market risk*)
  - ◆ Product not in scope with company plans (*strategic risk*)
  - ◆ Sales force does not know how to sell the product (*sales risk*)

# Known risks

---

- Identified before/during risk management
- Ex:
  - ◆ Unrealistic deadlines
  - ◆ No requirements
  - ◆ No focus
  - ◆ Poor development environment

# Predictable risks

---

- From previous experience
- Ex.
  - ◆ Personnel turnover
  - ◆ Poor communication with customer

# Boehm's top ten risk items

---

- ◆ Personnel shortfalls
- ◆ Unrealistic schedules and budgets
- ◆ Developing the wrong functions
- ◆ Developing the wrong user interfaces
- ◆ Gold-plating
- ◆ Continuing stream of requirements changes
- ◆ Shortfalls in externally-performed tasks
- ◆ Shortfalls in externally-furnished components
- ◆ Real-time performance shortfalls
- ◆ Straining computer science capabilities

# Other common risks

---

- ◆ instability of COTS (Commercial Off-The-Shelf) components/products
- ◆ interface with legacy
- ◆ stability of development platform (hw + sw)
- ◆ limitations of platform
- ◆ multi-site development
- ◆ use of new methodologies / technologies
- ◆ standards, laws
- ◆ development team involved in other activities
- ◆ communication/language problems

# Risk management terms

---

- Risk impact: the loss associated with the event
- Risk probability: the likelihood that the event will occur
- Risk control: the degree to which we can change the outcome

Risk exposure = (risk probability) x (risk impact)

# RM Process

---

- 1 – Risk assessment
  - ◆ identification
  - ◆ analysis
  - ◆ ranking
- 2 – Risk control
  - ◆ planning
  - ◆ monitoring

## Identification

---

- identify risks
  - ◆ checklist, taxonomies, questionnaires
    - PMI (Project Management Institute, PMBOK)
    - SEI (SEI-93-TR-06)
      - ex: technical, management, business risks
  - ◆ brainstorming
  - ◆ experience

# Analysis

---

- probability
  - ◆ very high, high, medium, low, very low
- impact
  - ◆ catastrophic, critical, marginal, negligible
- exposure
  - ◆ probability \* impact

# Exposure

---

| <b>Impact/<br/>probability</b> | <b>Very high</b> | <b>High</b> | <b>Medium</b> | <b>Low</b> | <b>Very low</b> |
|--------------------------------|------------------|-------------|---------------|------------|-----------------|
| <b>Catastrophic</b>            | High             | High        | Moderate      | Moderate   | Low             |
| <b>Critical</b>                | High             | High        | Moderate      | Low        | Null            |
| <b>Marginal</b>                | Moderate         | Moderate    | Low           | Null       | Null            |
| <b>Negligible</b>              | Moderate         | Low         | Low           | Null       | Null            |

# Ranking

---

- By exposure
- by qualitative assessments
  - ◆ only higher exposure risks are handled

# RM Process

---

- 1 – Risk assessment
  - ◆ identification
  - ◆ analysis
  - ◆ ranking
- 2 – Risk control
  - ◆ planning
  - ◆ monitoring

# Planning

---

- For selected risks (high in exposure)
  - ◆ define corrective actions
  - ◆ evaluate cost, decide if acceptable
  - ◆ insert actions in project plan

## Three strategies for risk reduction

---

- ◆ avoiding the risk: change requirements for performance or functionality
- ◆ transferring the risk: transfer to other system, or buy insurance
- ◆ assuming the risk: accept and control it

risk leverage = difference in risk exposure divided by cost of reducing the risk

# Ex.

---

- ABS for car, software controlled. More flexible, but risk of failure from software
  - ◆ Avoiding. No software controlled
  - ◆ Transfer. Insurance.
  - ◆ Assuming. Develop software with best techniques, apply redundancy.

# Ex.

---

- Risk leverage
  - ◆ ABS, software developed normally
    - cost 100KEuro,
    - risk exposure =  $10^{-3} * 1\text{M Euro}$
  - ◆ ABS, software developed best techniques
    - cost 1M Euro,
    - risk exposure =  $10^{-6} * 1\text{M Euro}$
  - ◆ Risk leverage  
$$\frac{10^{-3} * 1\text{M Euro} - 10^{-6} * 1\text{M Euro}}{(1\text{M} - 100\text{k})\text{Euro}}$$

## Company profiles and risk handling styles

---

- project owner – takes charge of risk
- fixed price contract
- work provider – no interest in risk

## Monitoring

---

- follow project plan, including corrective actions
- monitor status of risks
- identify new risks, assess them, update ranking

# Monitoring (2)

---

- Is part of PM that has to consider also
  - ♦ risk log (document)
  - ♦ risk reviews (activities)
    - also with external assessors
    - can be coupled with project reviews

# Risk log

---

| <b>Risk</b>               | <b>Probability</b> | <b>Impact</b> | <b>Exposure</b> | <b>Action</b>                                      | <b>Status</b> |
|---------------------------|--------------------|---------------|-----------------|--|---------------|
| hw platform not available | high               | Critical      | high            | Add software Layer compatible with other platforms | Under control |

# Actions for risks

---

- Personnel shortfalls
  - ◆ hire the best, the most suitable, training, team building, technical reviews
- unrealistic schedules and budget
  - ◆ more detailed plans, iterative process, reuse, new plans
- instability of components (COTS)
  - ◆ qualification, detailed analysis of product and vendor, software layer.

- 
- inadequate requirements
    - ◆ prototyping, JAD, iterative process, include user representative in process
      - Joint Application Development
  - inadequate user interface
    - ◆ study user needs, usability analysis, prototyping
  - requirement changes
    - ◆ suitable design, iterative process, rigid change control

- 
- Interface with legacy
    - ♦ reengineering, encapsulation, incremental change
  - subcontractors
    - ♦ contracts and payments, team building, assessments before and during
  - new technologies
    - ♦ prototyping, cost benefit analysis
